DATE MAILED: 09/05/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

## Office Action Summary

Application No.

09/726,847

Applicant(s)

HENRIE ET AL.

Examiner

Angel L. Casiano

Art Unit

2182

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 20 June 2003.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1,2,4-10 and 12-23 is/are pending in the application.
- 4a) Of the above claim(s) 3 and 11 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1,2,4-10 and 12-23 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 29 November 2000 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.  
If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

### Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).  
\* See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).  
a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

### Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892) 4) ☐ Interview Summary (PTO-413) Paper No(s). \_\_\_\_\_
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948) 5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) \_\_\_\_\_ 6) ☐ Other: \_\_\_\_\_

***Response to Amendment***

1. This Office action is in response to amendment filed on 20 June 2003.
2. Claims 1-2, 4-10, 12-23 are pending in the application.

***Specification***

3. Objection to the title has been overcome with the correction filed in the present amendment.

***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1-2, 4-10, 12-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hanson et al. [US 6,442,734 B1] in view of Severt et al. {US 5,602,750}.
6. Hanson et al. was cited as prior art in the previous Office action.

Regarding claim 1, Hanson et al. teaches a method for selecting an application used with a communication interface (see col. 1, lines 47-49) in a computer system. The cited method includes entering a mode for executing the application (see col.1, lines 50-56). It is also

Art Unit: 2182

disclosed the step of identifying the type of connection according to a resistance value (see col. 5, lines 13-15, 23-26, 36-37; col. 6, lines 21-23; col. 7, lines 5-8; col. 8, lines 31-32). Hanson et al. discloses the selection of an application form used with the identified type of communication interface (see col. 1, lines 58-61; col. 2, lines 53-56; col. 3, lines 21-23). However, it is not explicitly disclosed in the mentioned prior art the step of reading a resistance value of a pin on a cradle element that receives the portable computer system and that couples the personal computer system to a second computer system. Severt et al. discloses the use of a "cradle element" for receiving a portable computing system (see Fig. 3; col. 4, line 60). In addition, Hanson et al. exposes (see col. 8, lines 43-50) reading a pin in a communication device. The logical reading resulting from the cited pin is a measure of a resistor in the system (see col. 8, lines 53-55; Figure 5). Therefore, it is obvious that the signal reading resulting from the action of the resistor is an indicator of and depending on its resistance. Thus, resistance must be measured in the reference in order to cause a logical level, which is read on the cited pin. The measure of this resistance causes association between the obtained value and the type of connection (see col. 8, lines 63-67; col. 9, lines 1-3). Accordingly, although the reference does not disclose the computer system coupled to the communication interface as being portable, it does expose the method as applicable to a portable computer (see col. 3, lines 36-42). One of ordinary skill in the art would have been motivated to modify the cited disclosure by Hanson by including a cradle element in order to apply the cited method to portable computing systems.

Art Unit: 2182

As for claim 2, Hanson et al. discloses the step of entering a mode as responsive to input from a user, independent of the communication interface (see col. 4, lines 22-27). As it is exposed, the user can enter a mode to execute a particular application regardless of the type of interface.

As for claim 4, the cited prior art discloses the step of identifying the type of communication interface (see col. 5, lines 13-15, 23-26, 36-37; col. 8, lines 31-32). However, it is not explicitly disclosed in the reference the step of identifying the type of communication interface according to a voltage value in the pin. Nonetheless, Hanson et al. exposes (see col. 8, lines 49-50) reading a signal level in a pin. This signal constitutes a logical level (see col. 8, line 51). As it is well known in the art, a logic level in a system as the one disclosed in the prior art requires the reading and determination of a voltage value. It is obvious to one of ordinary skill in the art that a logic level is a voltage value that is translated into a logic value.

As for claim 5, it is not exposed in the prior art the step of selecting an application for debugging applications on the portable computer system. Nonetheless, the reference includes the selection of different applications to be used on the portable computer system (see col. 1, lines 53-56; col. 2, lines 56-59). It would have been obvious to one of ordinary skill in the art at the time the invention was made to include the selection of debugging applications on the portable system, since these are well known in the art.

As for claim 6, the reference discloses the selection of the application for sharing information (see col. 1, lines 53-56; col. 2, lines 56-59; col. 4, lines 38-47). Although communication

Art Unit: 2182

between a portable computer and a second computer is not explicitly disclosed, the reference does mention the applicability of the referenced method to portable systems (see col. 3, lines 36-42).

As for claim 7, the prior art teaches the identification of USB-type communication interface (see col. 8, lines 63-67; Figures 3A, 3B) and the use of applications with a USB communication interface (see col. 4, lines 19-20).

As for claim 8, the cited prior art does not teach the identification of an RS232 connection or the use of the application with an RS232 communication device. However, it does disclose that RS232 is a commonly used serial interface (see col. 1, lines 27-29). Therefore, it would have been obvious to expand the system and method disclosed by Hanson et al. in order to support RS232-type interface since it is a well known communication interface.

Regarding claim 9, the prior art teaches a computer system having a bus (see col. 3, line 52), a communication interface port coupled to the bus (see col. 2, lines 42-43; col. 8, lines 43-47), and a processor coupled to the bus (see col. 3, line 53; col. 4, lines 29-30). The processor in the Hanson et al. cited disclosure performs a method for selecting an application used with a type of communication interface (see Figure 1; col. 3, line 53; col. 5, lines 56-59, 64-65; col. 8, lines 43-47). The cited method also includes entering a mode for the execution of an application (see col.1, lines 50-56). It is also disclosed by Hanson et al. the step of identifying the type of communication interface according to a resistance value (see col. 5, lines 13-15, 23-26, 36-37;

Art Unit: 2182

col. 6, lines 21-23; col. 7, lines 5-8; col. 8, lines 31-32). Hanson et al. discloses the selection of an application form used with the identified type of connection (see col. 1, lines 58-61; col. 2, lines 53-56; col. 3, lines 21-23). However, it is not explicitly disclosed in the reference the step of reading a resistance value of a pin on a communication interface, where the type of connection is associated with a particular resistance value. Severt et al. discloses the use of a "cradle element" for receiving a portable computing system (see Fig. 3; col. 4, line 60). In addition, Hanson et al. teaches (see col. 8, lines 43-50) reading a pin in a communication device. The logical reading resulting from the prior art pin is a measure of a resistor in the system (see col. 8, lines 53-55; Figure 5). Therefore, it is obvious that the signal reading resulting from the action of the resistor depends on the particular resistance value. It is obvious that resistance must be measured in the prior art in order to cause a logical level, which is read on the referenced pin. The measure of resistance causes an association between the obtained value and the type of interface (see col. 8, lines 63-67; col. 9, lines 1-3). Accordingly, although the reference does not disclose the computer system coupled to the communication interface as being portable, it does expose the method as applicable to a portable computer (see col. 3, lines 36-42). Therefore, the applicability of the method disclosed in the prior art to a portable computer system is obvious to one of ordinary skill in the art. Furthermore, one of ordinary skill in the art would have been motivated to modify the cited disclosure by Hanson by including a cradle element in order to apply the cited method to portable computing systems.

Art Unit: 2182

As for claim 10, Hanson et al. discloses the method as including the step of entering a mode responsive to an input from a user (see col. 4, lines 22-27). In the prior art, the user can enter a mode to execute a particular application independent of the type of communication interface.

As for claim 12, the mentioned prior art teaches the step of identifying the type of communication interface (see col. 5, lines 13-15, 23-26, 36-37; col. 8, lines 31-32). However, it does not explicitly expose the step of identifying the type of interface according to a voltage value in the pin. Nonetheless, Hanson et al. teaches (see col. 8, lines 49-50) reading a signal level in a pin. This signal constitutes a logical level (see col. 8, line 51). As it is well known in the art, a logic level in a system as the one disclosed in the prior art requires the reading and determination of a voltage value. It is obvious to one of ordinary skill in the art that a logic level is a voltage value that is translated into logic.

As for claim 13, it is not disclosed in the prior art the step of selecting an application for debugging applications on the portable computer system. Nonetheless, the reference includes the selection of different applications to be used on the portable computer system (see col. 1, lines 53-56; col. 2, lines 56-59). It would have been obvious to one of ordinary skill in the art at the time the invention was made to include the selection of debugging applications on the portable system, since these are well known in the art.

As for claim 14, the reference discloses the selection of the application for sharing information (see col. 1, lines 53-56; col. 2, lines 56-59; col. 4, lines 38-47). Although communication

Art Unit: 2182

between a portable computer and a second computer is not explicitly disclosed, the reference does mention the applicability of the referenced method to portable systems (see col. 3, lines 36-42).

As for claim 15, the prior art teaches the identification of USB-type communication interface (see col. 8, lines 63-67; Figures 3A, 3B) as well as the use of applications with a USB communication interface (see col. 4, lines 19-20).

As for claim 16, the cited prior art does not disclose the identification of an RS232 connection or the use of an application with an RS232 communication device. However, it does expose that RS232 is a commonly used serial interface (see col. 1, lines 27-29). Therefore, it would have been obvious to expand the system and method disclosed by Hanson et al. in order to support RS232-type interfaces since it is a well-known communication interface.

Regarding claim 17, the prior art includes a method for selecting an application form used with a type of communication interface (see col. 1, lines 58-61; col. 2, lines 53-56; col. 3, lines 21-23). The method in the Hanson et al. cited disclosure performs the step of selecting an application used with a type of communication interface (see Figure 1; col. 3, line 53; col. 5, lines 56-59, 64-65; col. 8, lines 43-47). It is also disclosed by Hanson et al. the step of identifying the type of connection according to a resistance value (see col. 5, lines 13-15, 23-26, 36-37; col. 6, lines 21-23; col. 7, lines 5-8; col. 8, lines 31-32). Hanson et al. teaches the selection of an application form used with the identified type of communication interface (see col. 1, lines 58-61; col. 2,

Art Unit: 2182

lines 53-56; col. 3, lines 21-23). However, it is not explicitly disclosed in the reference the step of reading the resistance value of a pin on a “cradle element”, where the type of communication interface is associated with a particular resistance value. Severt et al. discloses the use of a “cradle element” for receiving a portable computing system (see Fig. 3; col. 4, line 60). In addition, Hanson et al. teaches (see col. 8, lines 43-50) reading a pin in a communication interface device. The logical reading resulting from the prior art pin is a measure of the resistance in the system (see col. 8, lines 53-55; Figure 5). It is obvious that the signal reading resulting from the action of the resistor depends on the particular resistance value. Therefore, it is obvious that resistance must be measured in the prior art in order to cause a logical level, which is read on the referenced pin. The measure of resistance causes an association between the obtained value and connection type (see col. 8, lines 63-67; col. 9, lines 1-3). Furthermore, although the reference does not disclose the computer system coupled to the communication interface as being portable, it does expose the method as applicable to a portable computer (see col. 3, lines 36-42). The applicability of the method disclosed in the prior art to a portable computer system is obvious to one of ordinary skill in the art. Furthermore, one of ordinary skill in the art would have been motivated to modify the cited disclosure by Hanson by including a cradle element in order to apply the cited method to portable computing systems.

As for claim 18, the prior art discloses the method as including the step of entering a mode responsive to an input from a user (see col. 4, lines 22-27). Hanson et al. teaches a method

Art Unit: 2182

where the user can enter a mode to execute a particular application independent of the type of communication interface.

As for claim 19, the mentioned prior art teaches the step of identifying the type of connection (see col. 5, lines 13-15, 23-26, 36-37; col. 8, lines 31-32). However, it does not explicitly expose the step of identifying the type of connection according to a voltage value in the pin. Nonetheless, Hanson et al. teaches (see col. 8, lines 49-50) reading a signal level in a pin. This signal constitutes a logical level (see col. 8, line 51). As it is well known in the art, a logic level in a system as the one disclosed in the prior art requires the reading and determination of a voltage value. It is obvious to one of ordinary skill in the art that a logic level is a voltage value that is translated into logic.

As for claim 20, it is not included in the prior art the step of selecting an application for debugging applications on the portable computer system. Nonetheless, the reference teaches the selection of different applications to be used on the portable computer system (see col. 1, lines 53-56; col. 2, lines 56-59). It would have been obvious to one of ordinary skill in the art at the time the invention was made to include the selection of debugging applications on the portable system, since these are well known in the art.

As for claim 21, the reference discloses the selection of the application for sharing information (see col. 1, lines 53-56; col. 2, lines 56-59; col. 4, lines 38-47). Although communication between a portable computer and a second computer is not explicitly disclosed, the reference

Art Unit: 2182

does mention the applicability of the referenced method to portable systems (see col. 3, lines 36-42).

As for claim 22, the prior art discloses the identification of USB-type connection (see col. 8, lines 63-67; Figures 3A, 3B) as well as the use of applications with a USB communication interface (see col. 4, lines 19-20).

As for claim 23, the cited prior art does not disclose the identification of an RS232 connection or the use of an application with an RS232 communication device. However, it does teach that RS232 is a commonly used serial interface (see col. 1, lines 27-29). Therefore, it would have been obvious to expand the system and method disclosed by Hanson et al. in order to support RS232-type connections since it is a well-known communication interface.

### ***Claim Rejections - 35 USC § 112***

7. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

8. Claims 1 and 9 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Art Unit: 2182

Regarding claims 1 and 9, step (d) cites “selecting a form of said application used with said type of connection identified in said step (c)”. However, the previous step cites “identifying a type of communication interface”. Therefore, the present claims are unclear.

### *Response to Arguments*

9. Applicant's arguments filed 20 June 2003 have been fully considered but they are not persuasive.

10. In response to applicant's arguments, Examiner agrees in that Hanson et al. does not teach a method including the step of reading a resistance value of a pin on a “cradle element” that receives the portable computer system and that couples the personal computer system to a second computer system. Nonetheless, Examiner respectfully states that Hanson et al. teaches a method for selecting an application used with a communication interface in a computer system. As part of the disclosure, Hanson et al. also teaches the steps of entering a mode for executing the application and identifying the type of connection according to a resistance value. In addition, Hanson et al. discloses the selection of an application form used with the identified type of communication interface. Although Hanson et al. does not explicitly teach a “cradle element”, it does expose the method as applicable to a portable computer. As Severt et al. teaches, a “cradle element” is well known in the art for the purposes of “receiving” a portable computing device (see also Applicant's admission of prior art; page 2, lines 7-9). Therefore, Examiner respectfully states that Hanson et al. suggests the use of a cradle element, since it discloses the applicability of its method to portable computer devices. One of ordinary skill in the art would have been motivated to combine the cited references in order to obtain a method

Art Unit: 2182

for identifying a type of communication interface applicable to portable computer systems, as Hanson et al. suggests.

### *Conclusion*

11. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Angel L. Casiano whose telephone number is 703-305-8301. The examiner can normally be reached on 8:00-5:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jeffrey Gaffin can be reached on 703-308-3301. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Art Unit: 2182

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-3900.
